## Task for lecture 5

Consider the non-linear equation.

$$x - \cos(x) = 0 \tag{1}$$

- Solve eq. 1 using Bisection in the interval:  $x_l = 0$ ,  $x_h = \frac{\pi}{2}$ . Note: use  $10^{-8}$  for accuracy.
- Print a table with at least the following values:  $k, x_k, d_k$ . Where  $d_k = x_k - x_{k-1}$ .
- Consider which other values will be relevant to print, and add these to the table.

k	$x_k$	$d_k$	?
1			
2			
3			
:			

When you have printed a NICE LOOKING! table with ALL! relevant values. Then Choose one of the following methods and repeat, with 10<sup>-</sup>16 as accuracy.

- Solve eq. 1 using Secant in the interval:  $x_l = 0, x_h = \frac{\pi}{2}$ .
- Solve eq. 1 using False Position in the interval:  $x_l = 0, x_h = \frac{\pi}{2}$ .
- Solve eq. 1 using Ridder in the interval:  $x_l = 0, x_h = \frac{\pi}{2}$ .
- Solve eq. 1 using Newtons method, using  $x_0 = 0$ .

Finally use the values from the tables to evaluate the efficiency of each the methods.

• Pick another method and Repeat.

It is expected that for next time you have done this for atleast Bisection and one other method
